No best model, only best matches: governance configurations and port resilience to two shocks

22 container ports · 5 governance conditions (C1 autonomy, C2 ownership hybridity, C3 coordination, C4 compound lock-in, C5 social value) · fsQCA · IMF PortWatch container calls

Two acute-phase windows

COVID-19 demand collapse
1 Jan – 30 Sep 2020

Red Sea rerouting
19 Nov 2023 – 18 Nov 2024

Outcome: trough depth × half-life of year-on-year container calls, calibrated (0 = fragile, 1 = resilient)

Resilience

No configuration is sufficient

Resilient ports are governed in divergent ways — compatible with, not proof of, equifinality

Fragility: patterned, and differently in each window

COVID-19

`~C1 · C2 · ~C3 · ~C4 · ~C5`

ministry-controlled, privatized ports (4 cases)
cons. 0.84, PRI 0.73
threshold-marginal

Red Sea window

`~C1 · ~C2 · ~C3 · C4 · C5`

compound lock-in in a port not exposed to the rerouting (Durban; one case)
cons. 0.99, PRI 0.96

Measured exposure is neither necessary nor sufficient.
The windows differ in context, not in a shock-specific pattern.

~ = absence of a condition; · = logical AND
